

The chart displays data points as bubbles, where the x-axis represents the 'Decade' (1650 to 1800) and the y-axis represents an unlabeled variable. The size of each bubble indicates a third variable. The data shows a general upward trend in the size of the bubbles over time, with a significant increase starting around 1750. The largest bubbles are concentrated in the later decades, particularly around 1775 and 1800.
